Subject:	Re: Folsom Water Control Manual

Hi Naseem,

Added a couple sentences on the Folsom water control manual BO to the baseline section per your recommendations

Keep in mind - and please pass along - if we would be including take for any new (not consulted on) activities. Or if we would still only be considering them at a framework-level (not having enough details)

also, if there is anything specific that could/should be added to baseline - let's do that: (annual?) redd scour

Couple outstanding questions from the latest BOR review of Am R effects-

I scanned through the Folsom water control manual BO and it covers take from high flows (redd scour) but does not cover take associated with other operations. Quickest way to address this would be to delete redd scour from the American R effects section (mentioned once) and the American R portions of the steelhead I&S (mentioned a few times). We can do that in our next revision.

The Folsom water control manual includes a description of down ramping rates for higher flows-

'Down ramping rates incorporated into the updated Folsom WCM in a release range of 8,000 cfs to 160,000 cfs, flows will not decrease by more than 10,000 cfs over any 2-hour period.'

Ramping under lower flow ranges isn't described in the Folsom control manual or the BA so our use of historical flow fluctuations was probably appropriate for analyzing effects of American R flow fluctuations in the PA.

If the answer is Yes, is the updating just deleting things, or more complicated?

Kristin from reclamation is going to add a couple sentences on this in their surgical edit of the American R effects. We have one reference to 'NMFS 2018' but nothing in the bibliography so that may have something to do with the water control manual BO. Kristin mentioned that looking at historic flow fluctuations is not appropriate with construction of the new spillway but not sure how to characterize that.

More importantly, if the new water control manual covers take associated with flood management should we remove redd dewatering/stranding from the effects and add it to baseline/not consulted on? We'll have to update a bunch of stuff if it's removed from the effects analysis

Thanks

Joe

## Joe,

Here is the location of the flood biop. It's long, so I would look at the integration and synthesis and conditions. M:\SA-FINAL Biological Opinions\2018 - 2018-10-16-Folsom-Dam-And-Lake-Water-Control-Manual-BO-Signed
