Hi Garwin,

I have finished updating the east side effects section. The new version is on the server and is called "2.5 and 2.6 East Side Effects V10". Please let me know if you have any questions.

Kristin

Kristin,

As you know, Barb is tied up with higher priority assignments, at least through the end of this week.

As mentioned last night, we received comments back from Rosalie on the East Side Division effects section, which you already placed in the ROCON drive.

-- The "Date modified" field indicates that the "2.5 and 2.6 East Side Effects V8\_KMB3-GY" is more current than "2.5 and 2.6 East Side Effects V8--to reviewers-do not change." Whichever is the most current, please use that version as the base/your master, rename it, then incorporate Rosalie's track changes from the file "2.5 and 2.6 East Side Division Effects--to reviewers.rd" into it.

-- Please address all outstanding comments, and Rosalie's track changes, so in the end, we will have a clean document with only comment bubbles for references.

-- Note that I will be sending out task e-mails individually, and you may have overlapping tasks. If you need help with workload or priorities, Howard, Cathy, and/or I will be available to help.

-- Please see Barb's response, below, regarding contaminants.

-- PA-NMI scenario: We don't have time to debate the rationale for in or out, and it's not worth the effort to remove the scenario from the effects section, but please make sure that the text explains/clarifies the need for it.

I don't expect Barb to work on this (please don't), but be available to Kristin if questions arise.

Thanks!

-Garwin-

**Contaminants:** I did delete contaminants from the table of stressors, but think I forgot to list it as N/A (think now -- rather than N/A) in the introductory table of Recovery Plan stressors, so should be changed there. I never had a writeup associated with, so no narrative to delete.

**PA-NMI.** If we delete PA-NMI, it causes problems with the entire yeartype distribution analysis because the current write-up hinges on that scenario. I don't believe it is irrelevant to understand the individual PA components; in fact we were directed to do so. Because of the interaction between the flow schedules and the yeartype method on the Stan, we can NOT evaluate those separate PA components without the "bridging" PA-NMI scenario.

I am open to keeping in some general conclusions and moving the full analysis to an appendix, or to my memo to the record (but not sure that works since readers of the BiOp won't know what I've done), but that takes time we don't have to shift it around and explain it in a new place.

How is this different from Evan noting that temperature improvements are from better storage, not a better temp management method? The situation seems very analogous, and I think part of our evaluation is to understand from which PA component effects are coming from.

Kristin,

Can you take on addressing the remaining comments in the East Side Division? Barb will be tied up at least through the remainder of the week.

Within the comments, 2 are on my mind:

- contaminants: delete that subsection/analysis, double check the environmental baseline section to make sure ag is addressed.
- PA-NMI scenario: Barb has a response to my comment about why that scenario is in the analysis. Seems to me that we need to analyze the effects of the action, not try to figure out whether PA minus COS, or 60-20-20 minus/vs. NMI is the cause of the adverse effects. I suggest deleting that/those sections.
