

NMFS Biological Opinion Draft Analytical Approach for Salmonids and Sturgeon

Reinitiation of Consultation on the Coordinated Long-Term Operations of the CVP/SWP April 15, 2019

Determinations Approach

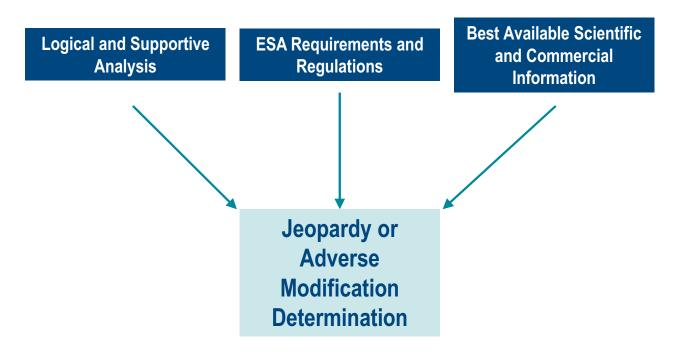

Objectives of Analytical Approach

- To "jeopardize the continued existence of a listed species" is "to engage in an action that
 would be expected, directly or indirectly, to reduce appreciably the likelihood of both the
 survival and recovery of a listed species in the wild by reducing the reproduction,
 numbers, or distribution of that species" (50 CFR 402.02)
- Destruction or adverse modification "means a direct or indirect alteration that appreciably diminishes the value of critical habitat for the conservation of a listed species. Such alterations may include, but are not limited to, those that alter the physical or biological features essential to the conservation of a species or that preclude or significantly delay development of such features" (81 FR 7214; February 11, 2016)

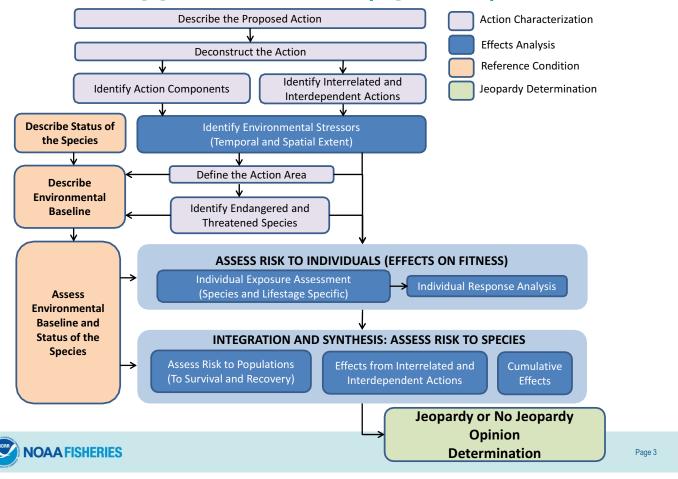

Jeopardy or Adverse Modification Determination

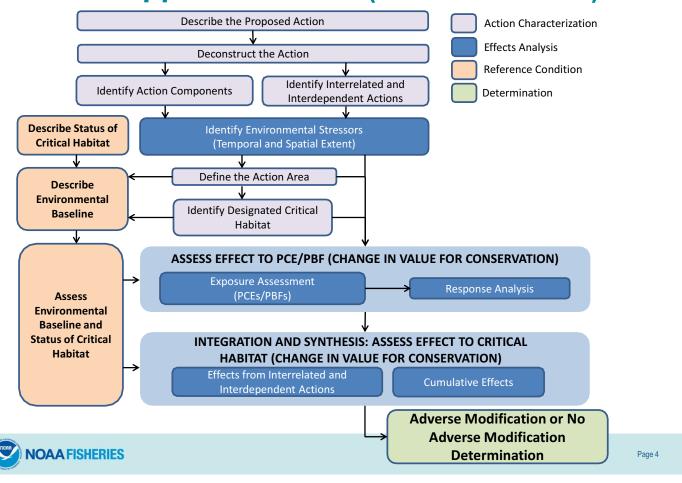

Objectives of Analytical Approach

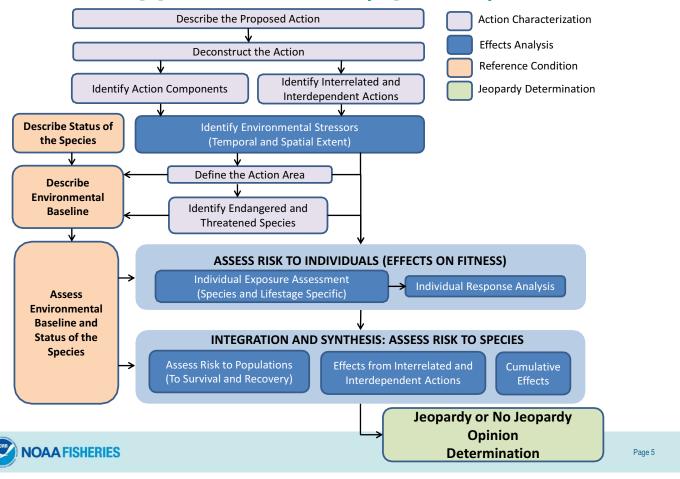

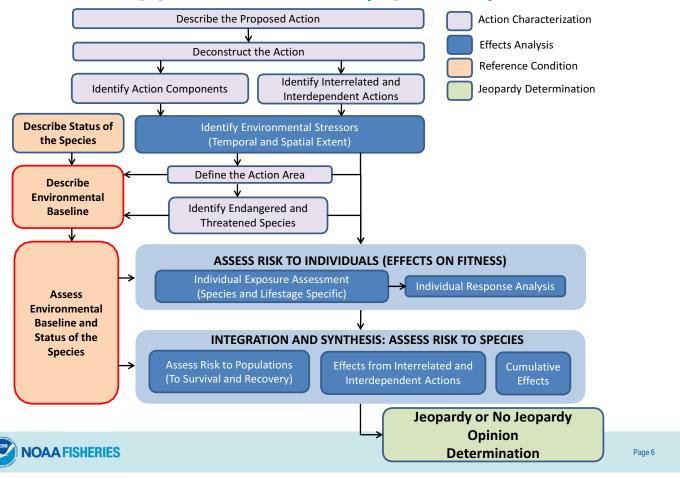

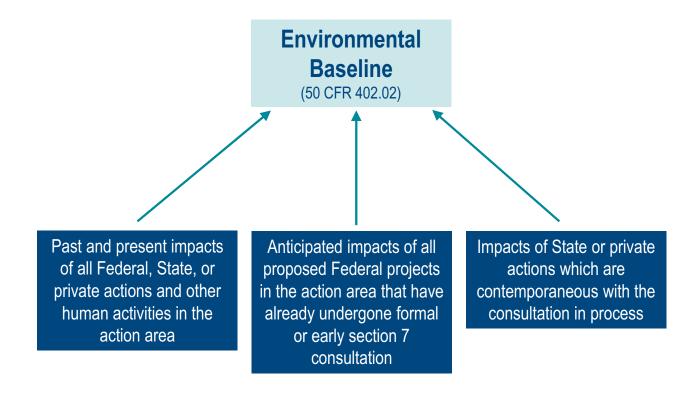

General Approach Model (Critical Habitat)

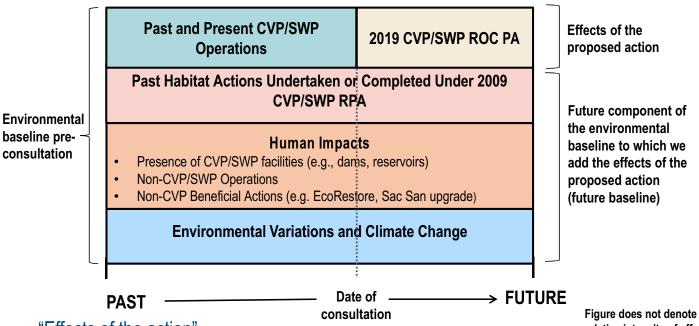

Environmental Baseline

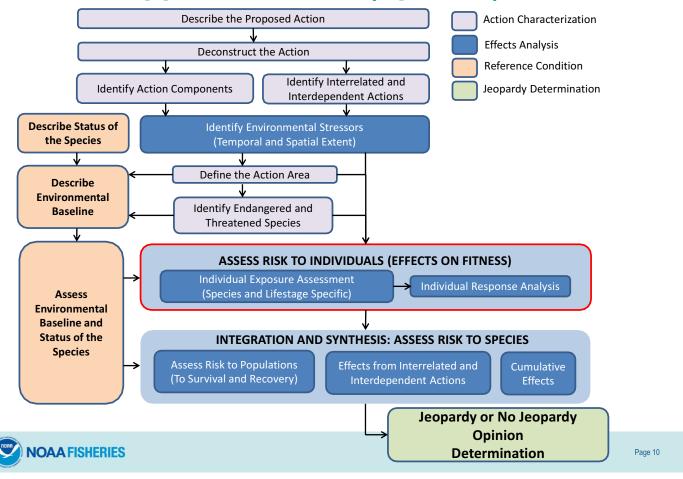

Environmental Baseline

- "Effects of the action"
 - Direct and indirect effects of the proposed action
 - Effects of interrelated or interdependent activities
 - "...added to the environmental baseline" (50 CFR 402.02)

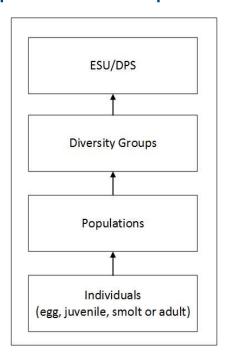

relative intensity of effect or whether impacts are positive or negative; temporal variability of effect/impact is not depicted.

Application of Approach to Species - Individuals

Species risk depends on response of individuals

Application of Approach to Species - Individuals

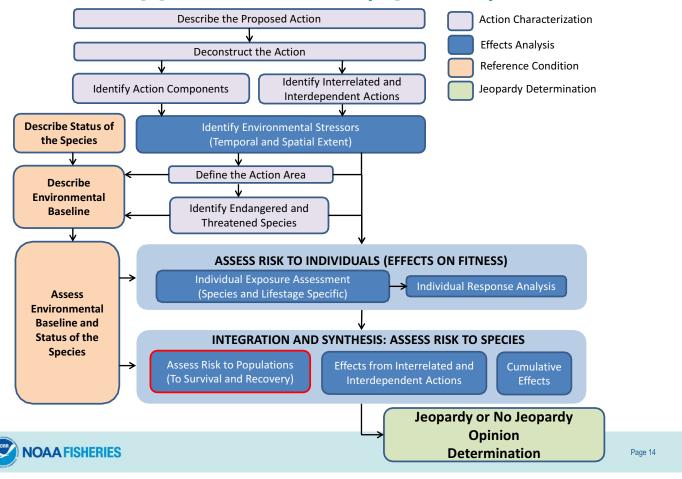

- "Exposure-response-risk"
- Risk = exposure + response
- Baseline can affect exposure and response
- Fitness metrics
 - Growth rate
 - Survival probability
 - Reproductive success

Application of Approach to Species - Individuals

Stressor	Life Stage (Location)	Life Stage Timing (Work Window Intersection)	Individual Response and Rationale of Effect	Severity of Stressor	Proportion of Population Exposed	Frequency of Exposure	Magnitude of Effect	Weight of Evidence	Probable Change in Fitness
Temperature	Steelhead Juveniles (Keswick Dam - RBDD)	January - July	Temperatures in excess of 61°F can lead to stress, disease, bioenergetic depletion, or death among rearing Juveniles.	Sublethal	Medium (11% of days >61°F)	Medium (61% of years)	Medium	Medium: Supported by multiple scientific and technical publications, however not specific to the region and species.	Reduced growth rate

Application of Approach to Species - Populations

- Population risk compared to reference condition
- To "jeopardize the continued existence of a listed species" is "to engage in an action that would be expected, directly or indirectly, to *reduce appreciably* the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species" (50 CFR 402.02)

Application of Approach to Species - Populations

Viable Salmonid Populations

- Abundance
- Productivity
- Spatial Structure
- Diversity and Habitat Capacity

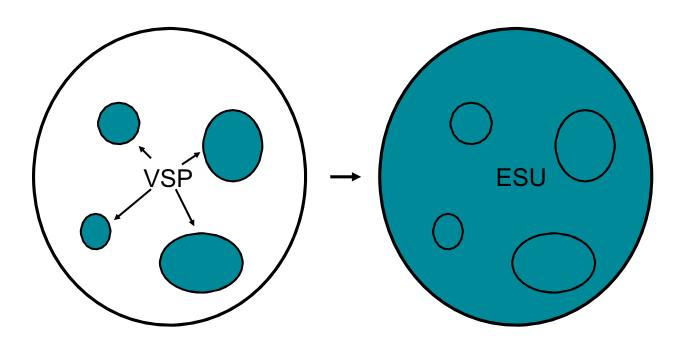

Jeopardy Standard

- = Numbers
- = Reproduction
- = Distribution
- Numbers, Reproduction and Distribution

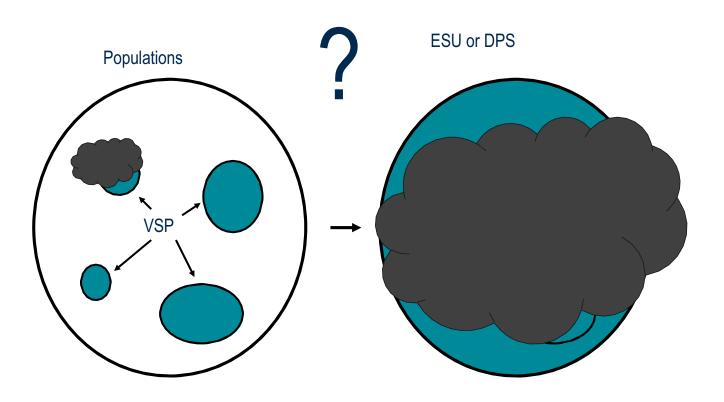

GOAL: Achieve at least a low risk of extinction for focal populations.

Measure extinction risk in terms of: Viability of populations within the ESU \rightarrow Viability of the ESU

Jeopardy or No Jeopardy Determination

Step	Apply the Available Evidence to Determine if	True/False	Action
Α	The proposed action is not likely to produce stressors that have direct		End
^	or indirect adverse consequences on the environment	False	Go to B
В	Listed individuals are not likely to be exposed to one or more of those stressors or one or more of the direct or indirect consequences of the	True	NLAA
	proposed action	False	Go to C
С	Listed individuals are not likely to respond upon being exposed to one	True	NLAA
	or more of the stressors produced by the proposed action	False	Go to D
D	Any responses are not likely to constitute "take" or reduce the fitness of	True	NLAA
	the individuals that have been exposed.	False	Go to E
E	Any reductions in individual fitness are not likely to reduce the viability of the populations those individuals represent.	True	LAA, but NLJ
	or the populations through the processing	False	Go to F
F	Any reductions in the viability of the exposed populations are not likely	True	LAA, but NLJ
	to reduce the viability of the species.	False	LJ

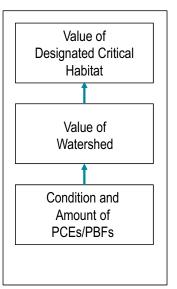

General Approach Model (Critical Habitat)

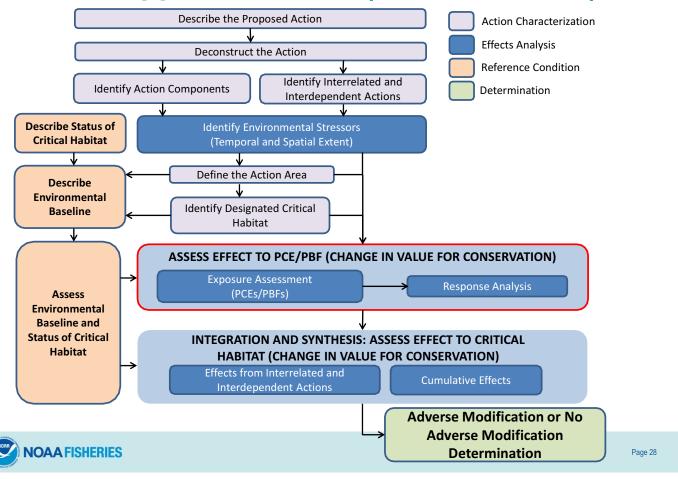

Application of Approach to Critical Habitat

Conservation value of habitat depends on condition of components

General Approach Model (Critical Habitat)

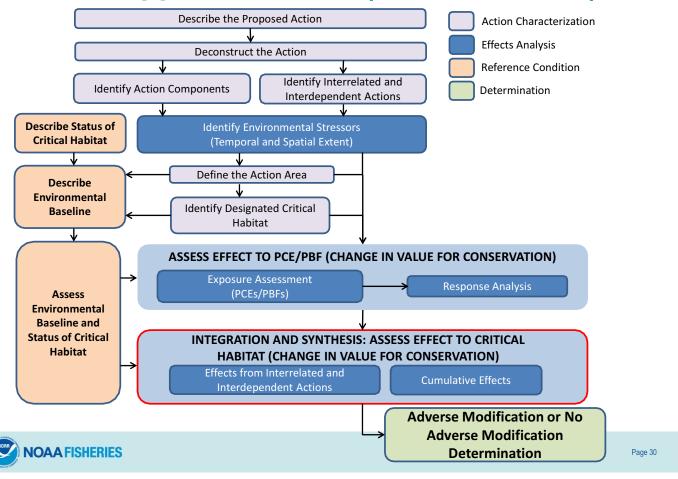

Application of Approach to Critical Habitat

- "Exposure-response-risk"
- Effects to PCE/PBF
 - Quality
 - Quantity
 - Potential/Capacity

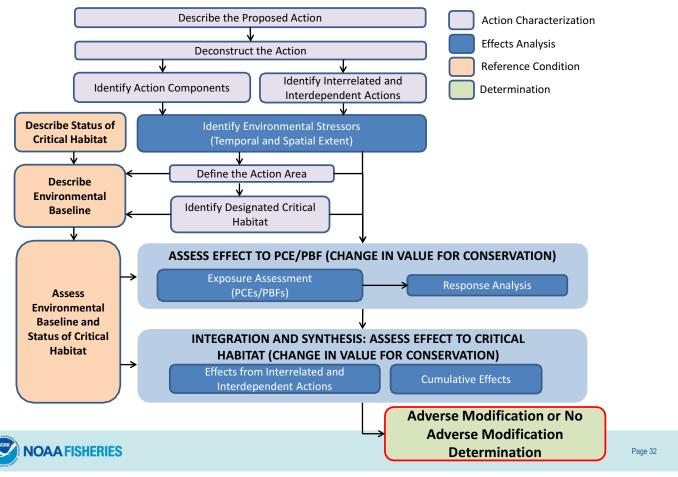

Action Component	Location of Effect	PCEs/Physical and Biological Features Affected	Response and Rationale of Effect	Magnitude of Effect (High, Medium, Low)	Weight of Evidence (High, Medium, Low)	Probable Change in Conservation Value
In-water operation of construction equipment	Within designated CH	Freshwater rearing habitat	Elevated turbidity and suspended sediment degrades water quality and food- producing areas	Medium	Medium	Negative

General Approach Model (Critical Habitat)

General Approach Model (Critical Habitat)

Application of Approach to Critical Habitat

- Based on critical habitat as a whole
- Small impacts can appreciably diminish the value for conservation

Application of Approach to Critical Habitat - Determination

Step	Apply the Available Evidence to Determine if	True/False	Action
Α	The proposed action is not likely to produce stressors that have direct or indirect adverse	True	End
	consequences on the environment.	False	Go to B
В	Areas of designated critical habitat are not likely to be exposed to one or more of those	True	NLAA
	stressors or one or more of the direct or indirect consequences of the proposed action.	False	Go to C
С	The quantity or quality of any physical or biological features or primary constituent elements of	True	NLAA
	critical habitat or capacity of that habitat to develop those features over time are not likely to be reduced upon being exposed to one or more of the stressors produced by the proposed action	False	Go to D
D	Any reductions in the quantity or quality of one or more physical or biological features or	True	NLAA
	primary constituent elements of critical habitat or capacity of that habitat to develop those features over time are not likely to reduce the value of critical habitat for the conservation of the species in the exposed area.	False	Go to E
E		True	LAA, but
	Any reductions in the value of critical habitat for the conservation of the species in the exposed area of critical habitat are not likely to appreciably diminish the overall value of critical habitat for the conservation of the species.		No D/AD MOD
		False	D/AD MOD

Analytical Methods and Uncertainty

Primary Analytical Models*

- CalSimII
- DSM2-HYDRO
- HEC-5Q
- Reclamation Egg Morality Model/SacSalMort
- SALMOD
- DPM
- IOS
- Central Valley Chinook Life Cycle Model
- Temperature-Dependent Egg Mortality Model
- Anderson Egg Mortality Model
- Floodplain Inundation
- WUA Analysis
- Perry and Pope STARS Model

*Subject to Finalization

Institutionalized Caution

- All data, analytical methods, and effects have uncertainty
- Courts have cited Congress' intent in the ESA to give the benefit of the doubt to the species¹
- NMFS will embrace this principle, which the U.S.
 Supreme Court has called "institutionalized caution"
