**Subject:** Re: Shasta Work

In my opinion - for ALL actions we are not going to give take, don't have enough details, had some uncertainties and make some assumptions for general effects expected - we start with "Framework-level action component" instead of "uncertain. programmatic action component"

This will also be greatly helpful for us to track to ITS.

Ok, I'm looking at I&S tables for WR (and the other species) for Shasta. There are some "individual response and effect" column entries -- and for other columns -- that start with "uncertain" but then have an explanation. Are we 1) gearing towards not having the word "uncertain" in here at all **OR** 2) ok with it like this example for the small screen program:

"Uncertain. Programmatic action component. Operation of installed fish screens are assumed to comply with NMFS and CDFW fish screening guidance. Reduced entrainment into unscreened diversions and minimized potential for injury caused by impingement."

I'm a bit behind the game in this but also though that Evan had it under control. I'm doing a check of his work since he's out and maybe I don't have the mark of what I'm checking for.

So I'm looking for the definitive word, and I'll change these to what they need to be (but probably not until Tues night).

Thanks -  
Cathy

sounds like you carried it through, so I can take a quick look at the conclusions throughout if you want.

did you do all you need to in that? I reviewed your previous comments and revisions and Evans responses, if it was a case where one was warranted. I also inserted the framework level text a few more times where it seemed to be missing.

I by no means did a start to finish review, but I did look specifically at your review and his response. Let me know if there is more.

I guess I'll do it Monday or Tuesday!
